Ce document doit être référencé comme suit :

BUCHET J. & BOUSQUET T., 2017 – *Élaboration d'une première version du catalogue de la flore vasculaire de Normandie – Note méthodologique pour la fusion des listes préexistantes de la flore de Haute et de Basse-Normandie*. Conservatoires botaniques nationaux de Bailleul et de Brest, 6p.

L'élaboration d'une première version du catalogue de la flore vasculaire de Normandie a consisté à fusionner les catalogues des anciennes régions Haute-Normandie et Basse-Normandie, réalisés respectivement par le CBN de Bailleul et le CBN de Brest en 2015.

Plusieurs éléments ont rendu ce travail particulièrement complexe. En premier lieu, les deux conservatoires botaniques utilisent des **nomenclatures de référence différentes**. Ceci pour des raisons liées principalement à l'utilisation d'ouvrages de référence différents pour la détermination des espèces sur le terrain.

- Dans le catalogue de Haute-Normandie 2015, les espèces sont nommées selon la systématique de la « Nouvelle flore de la Belgique, du Grand-duché de Luxembourg, du Nord de la France et des régions voisines (J. LAMBINON et al., 2012 - 6ème édition).
- Dans le catalogue de Basse-Normandie 2015, les espèces sont nommées selon la systématique du Référentiel des Noms d'usage de la Flore de l'Ouest de la France (R.N.F.O), qui rassemble tous les noms de plantes vasculaires citées sur le territoire d'agrément du CBN de Brest et établit, sur la base de choix argumentés, sa propre nomenclature de référence.

Exemples :

Orchis anthropophora (L.) All. en Haute-Normandie correspond à *Aceras anthropophorum* (L.) en Basse-Normandie.
Persicaria maculosa S.F.Gray, nom. Conserv en Haute-Normandie correspond à *Polygonum persicaria* L. en Basse-Normandie.

Il a donc été nécessaire de **verser les deux catalogues sous une nomenclature commune** afin de disposer d'un nom valide unique pour l'ensemble des espèces présentes en Normandie. Le choix a été porté sur le **référentiel taxonomique national TAXREF7**. Ce référentiel est en effet déjà utilisé par l'ensemble des CBN pour compiler, au niveau national, l'ensemble des données floristiques présentes dans leurs bases de données respectives. Chaque CBN a donc au préalable réalisé un travail de correspondance entre son référentiel taxonomique interne et le référentiel national que nous avons cherché à exploiter.

Les deux catalogues ont donc été fusionnés avec les noms TAXREF7 comme dénominateur commun, d'abord sous tableur Excel, puis sous forme de base de données accessible à partir de l'extranet du CBN Brest (cf. figure 1), regroupant **4 660 lignes à traiter**. Deux colonnes ont été ajoutées à celles existantes : une colonne « choix_nom » qui correspond au nom Taxref7 retenu et une colonne « remarque » pour rédiger un commentaire si nécessaire.

Figure 1 : Aperçu de la base de données réalisée pour le travail de correspondance.

L'analyse des correspondances entre référentiels internes des deux CBN et TAXREF7 a rapidement mis en évidence **d'importantes disparités de rattachement synonymique** entre les deux CBN, qu'il a fallu traiter manuellement. Ces disparités étaient **surtout de l'ordre de la précision du rang taxonomique de rattachement**.

Exemple :

Cirsium eriophorum (L.) Scop. rattaché à *Cirsium eriophorum* (L.) Scop., par Brest et à *Cirsium eriophorum* (L.) Scop. subsp. *erriophorum*, sous-espèce autonome (seule présente en France) par Bailleul.

Sur les 4 660 lignes à traiter, environ 1 840 ont pu être automatiquement renseignés (taxons présents dans les 2 régions et sous un nom identique). 870 lignes correspondant aux rangs taxonomiques supérieurs à l'espèce (genres, familles, ordres) ont par ailleurs été écartées, ce qui aboutit à environ **1950 cas qui ont dû être traités manuellement**.

La fusion des deux catalogues a également mis en évidence **deux approches différentes concernant les taxons à faire figurer dans un catalogue floristique régional**. Les différences concernaient principalement :

- les taxons cités par erreur dans la littérature, dans l'une ou l'autre des ex-régions ;
- les taxons dont la présence est encore hypothétique sur le territoire ;
- les taxons cultivés et très rarement observés à l'état subspontané.

Il a été choisi de conserver la plupart des taxons des 2 premières catégories qui présentent l'intérêt d'attirer l'attention du botaniste sur des erreurs de déterminations à éviter ou des taxons à rechercher, souvent méconnus et de détermination délicate. En revanche, de nombreux taxons de la troisième catégorie (taxons cultivés) ont été retranchés et ne figurent donc pas au catalogue de Normandie.

Une fois l'ensemble des opérations préalables réalisées, ce sont en tout **3194 taxons** qui figurent au catalogue de la flore de Normandie, la Basse-Normandie y contribuant à hauteur de 2270 taxons et la Haute Normandie à hauteur de 2731 taxons.

Dans cette première version du catalogue normand, **les indicateurs habituels n'ont pas été régionalisés** (indigénat, rareté régionale, menace régionale, protection, etc). Ce travail sera réalisé dans la période 2017-2019. Néanmoins, **les indicateurs des deux anciens catalogues ont été affichés en vis-à-vis**. EN l'absence d'indicateur régional établi, ce rapprochement donne au lecteur une première image de la valeur patrimoniale de chaque taxon en Normandie et permet d'identifier les disparités pouvant exister entre les 2 anciennes régions.

Il est prévu, dès 2017, d'établir pour chaque taxon, un **statut d'indigénat régional** ainsi qu'un **statut de rareté**. Pour ces 2 indicateurs, le choix d'une méthodologie et de définitions communes sera un préalable obligatoire. Les autres indicateurs tels que cotation UICN du niveau de menace, législation plantes exotiques envahissantes, plantes déterminantes de ZNIEFF, plantes indicatrices de zones humides..., seront complétés à partir de 2018.
